## **REMARKS**

Applicants include a drawing Replacement Sheet providing a correction thereto which brings it into conformance with the actual description of the invention. Specifically, the arrow running from between the boxes 18, 20 to the box 10 has been removed.

Claims 2-6 are in the case. These claims stand rejected under 35 USC 103 over Takada et al., US Publication Number 2002/0089931, in view of Shipley, US Patent Number 5,633,742. It is respectfully submitted that these claims should be allowed.

Initially, in regard to all these claims, it is respectfully submitted that it would not be obvious to combine these documents as suggested by the Examiner. All of the setting and changes of values of flag fields in Takada et al. are related only to the control of the flow of data on the Internet (see for example paragraphs [0002]-[0009]). None of these settings or changes of flag field has anything to do with testing. The Examiner apparently recognizes this and goes on to state:

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the system of Takada et al. by using the features, as taught by Shipley, in order to provide a monitoring system for communication devices that are battery powered (see columns 3-4).

The Examiner in particular refers to column 14, lines 25-35 of Shipley, quoted in full:

The transmitter 31 of the present invention is provided with a battery check circuit 181 which is utilized to monitor the battery 71 periodically to provide an advance warning that the battery will need replacement in the near future. The battery check circuit 181 includes the transistor Q7 and a Zener diode D1 of a suitable type such as a LM385 connected in the manner shown. This battery check circuit 181 tests the battery voltage during every transmitted packet. If the battery voltage is at an acceptable level and a switch message is not being sent, a battery check message BOK is sent along with the normal transmitter identification confirming the battery condition.

**PATENT** 

The Examiner also refers to columns 3 and 4 of Shipley. Lines 35-41 of column 3 of

Shipley are quoted in full:

In general it is an object of the present invention to provide an optical data

communication and location apparatus, system and method and transmitters and

receivers for use therewith which provides continuous real time information on

the location of people, equipment, files and other mobile objects in a facility.

As will be noted, the type of device described in Shipley is quite limited in its scope of

operation, and consequently lends itself to battery power. The Internet as discussed in Takada et

al. is not a monitoring system and is not, nor would it be, battery powered.

As is well understood, the Examiner must provide an apparent reason to combine the

known elements in the fashion claimed and must articulate this reasoning with a rational

underpinning to support a conclusion of obviousness. As stated in KSR International Co. v.

Teleflex, Inc. (U.S. Supreme Court), 550 U.S. (2007):

Often, it will be necessary for a court to look to interrelated teachings of multiple

patents; the effects of demands known to the design community or present in the

marketplace; and the background knowledge possessed by a person having

ordinary skill in the art, all in order to determine whether there was an apparent

reason to combine the known elements in the fashion claimed by the patent at

issue. To facilitate review, this analysis should be made explicit. See *In re Kahn*, 441 F. 3d 977, 988 (CA Fed. 2006) ("R]ejections on obviousness grounds cannot

be sustained by mere conclusory statements; instead, there must be some

articulated reasoning with some rational underpinning to support the legal

conclusion of obviousness").

Applicants submit that not only is there no apparent reason to combine the known

elements of Takada et al. and Shipley, such a change would not be undertake as it would be

impractical.

(650) 961-5658

It is therefore respectfully submitted that it would not be obvious to combine the

disclosures as suggested by the Examiner, and that claims 2-6 should be allowed on this basis.

Serial No. 10/791,914

3

In regard to claims 3, 4, 5 and 6 each of these claims includes the limitation of <u>not</u> testing the device if the flag of the packet class is in the second state. As set forth in the portion of Shipley quoted above (column 14, lines 25-35), the battery check <u>tests the battery voltage during every transmitted packet</u>. There is no situation where a packet is transmitted and the battery is not <u>tested</u>. Thus, even if the references were combined as suggested by the Examiner, there is no disclosure of not testing the device for a transmitted packet. It is therefore respectfully submitted that even if the references were combined as suggested by the Examiner, this limitation would not be met, i.e. the resulting method would not anticipate applicant's claim 3-6.

It is therefore respectfully submitted that claims 2-6 should be allowed. Reconsideration and allowance of such claims are respectfully solicited.

Respectfully submitted,

Paul J. Winters Reg. No. 25,246

Attorney for Applicant(s)

I certify that this document is being deposited on February 4, 2008 with the U.S. Postal Service as first class mail under 37 C.F.R. §1.8 addressed to the Commissioner for Patents, P.O. Box 1450, Alexandria VA 22313-1450
